

It never takes a position it can't cover.

An autonomous options agent on Alpaca. Every structure's maximum loss is computed and reserved before the order is submitted.

\$0

THE UNANSWERED QUESTION

Most trading agents can tell you what they bought.

Very few can tell you what it costs them if it goes against them — **before** they buy it.

GIVEN AN ACCOUNT

an agent
will trade

That part is solved.

WHAT IS NOT SHOWN

the downside

WHAT VIG SHOWS

before the order

CHECKABLE

every position

The flat floors are the claim.

Four legs, which is exactly Alpaca's **--1legs** limit. Only one side can ever be breached, so maximum loss is width minus credit — known before the order exists.

The proof and the order are the same request.

ONE COMMAND, SENT TWICE

```
alpaca order submit
  --order-class mleg --qty 5
  --type limit --limit-price 0.53
  --client-order-id vig-3f9a1c22
  --legs [ 4 legs ]
```

```
--dry-run  renders it
           then sends it
```

RENDERED, NOT SENT

--dry-run

The exact request body, before anything reaches the market.

SENT, UNCHANGED

identical argv

Each structure carries its receipt, and the receipt is the command.

Eight gates. Every one can say no.

A structure reaches the broker only after clearing all of them. The refusals are shown beside the fills, because an agent that only reports what it did is hiding half its judgement.

01 illiquid any leg wider than \$0.15	02 thin-credit credit under 10% of width	03 position-too-large one structure over 5% of equity	04 bucket-full one underlying and expiry over 6%
05 book-full total reserved past the 25% ceiling	06 no-wing the protective strike does not exist	07 inverted short strikes crossed	08 regime the newswire says stand aside

UNCOVERED EXPOSURE

\$0

An order that would not be covered is never sent.

WORST CASE IF ALL BREACH

\$26,573

ALREADY RESERVED

\$26,573

OPEN STRUCTURES

12

PREMIUM COLLECTED

\$3,727

They match because they have to. Live on a paper account across SPY, QQQ and IWM — every figure read through the Alpaca CLI, none of it mocked.

WHAT THIS DOES NOT CLAIM

Two and a half sessions prove nothing.

That is not a sample size from which an edge can be inferred, and none is claimed. Selling premium wins often and loses occasionally larger; the ceilings bound what that can cost rather than pretending it away.

ENVIRONMENT

paper only

SKEW

negative,
and stated

UNDERLYINGS

correlated

WHAT IS CHECKABLE

Every position is covered before it exists.
